Safety

Follow the manual

The IC is only safe in operation if all instructions are read in this datasheet.

General understanding of safety

By the IC there are no hazard under normal use.

Intended Use

The IC is designed for driving small to middle displays.

The power should come from a safe transformer (also protected transformer) or a corresponding low voltage power supply for the circuit.

Never use a higher voltage or direct mains voltage!

Concealed Hazards

DANGER

following hazards may arise in case of wrong construction of the circuit and wrong handling of IC:

-  With the direct connection to mains, it's a dangerous voltage on the IC and other components, use a safety transformer!
-  Reverse polarity and overloading the IC may cause in smoke. This smoke possibly contains toxic substances which must not be inhaled! Ventilate the room.
-   Reverse polarity or overload of the IC can cause a hot surface on the IC or other component in the circuit.
 - There is a risk of burning when touching.
 - And flammable materials, for example Paper, can come in fire.
-  Spalling of parts on reverse polarity or overloading of the IC.
-  Wear during the initial commissioning eye protection.
-  The pins of a IC are very pointed and sharp! Therefore, this may cause in sores in case of incorrect handling.

Modifications of the example circuit

The successfully built circuit may be damaged. Therefore check as appropriate all housing part and lines for damage. This applies in particular to parts of the directly (for example power cord and power supply) or indirectly come into contact with mains voltage.

Application and function description

Function description

The IC SPM110X ... is a digital mono-flop IC with display and buttons for setup. It has a buzzer output for Sound notification that the time has expired and an output for switching a load via relay, transistor, etc..

The IC is a programmed microcontroller of the AVR family by Atmel. The circuit can be used for different purposes, because the target file is free for download, the circuit can be arbitrarily Modified.

This IC has the standard **OnChip display technology** and is suitable for small displays. These can be connected directly to the IC and require only 6 additional resistors.

Functions

- Adjustable digital timer ranges from 10 milliseconds to 99 seconds and 99 milliseconds, 1 second to 99 minutes and 59 seconds or 1 minute to 99 hours and 99 minutes.
 - The set time is stored in the internal EEPROM
 - Easy to start, with just one button press
 - Pause function interrupts the countdown
 - Signal sounds after the time, for a preset time or upto press the button start-stop.
 - An output for switching loads, relays, solid relays or similar. After inverting transistor BC547C 100mA output load (or similar type).
 - This IC has the Classic Screen display and the new default view, the differences are seen to www.stefpro.biz as gif video.
- Extra Menu button to change the settings easily or press 1 second the Start/Stop button.
- LED test, at power up all the LEDs turned on for 1 second in order to facilitate the quality control
- It requires no additional IC's without voltage regulator.
- Low power consumption. Requires a power below 100 mW.

Application

- For second exact exposure of PCBs, screen printing templates ...
- Precisely timed Baking of plastics
- Timed bonding
- Timed flow control

Functional states

The START button is to press for the state start and stop.

With button DOWN in state "Setting Wait" the time can be lowered in seconds. In state "Pause" the countdown can be stopped by this key.

With button UP in state "Setting Wait" the time can be increased in seconds. In state "start" and "pause" this key functions as start / pause button.

The functional states can be seen in Figure 1.

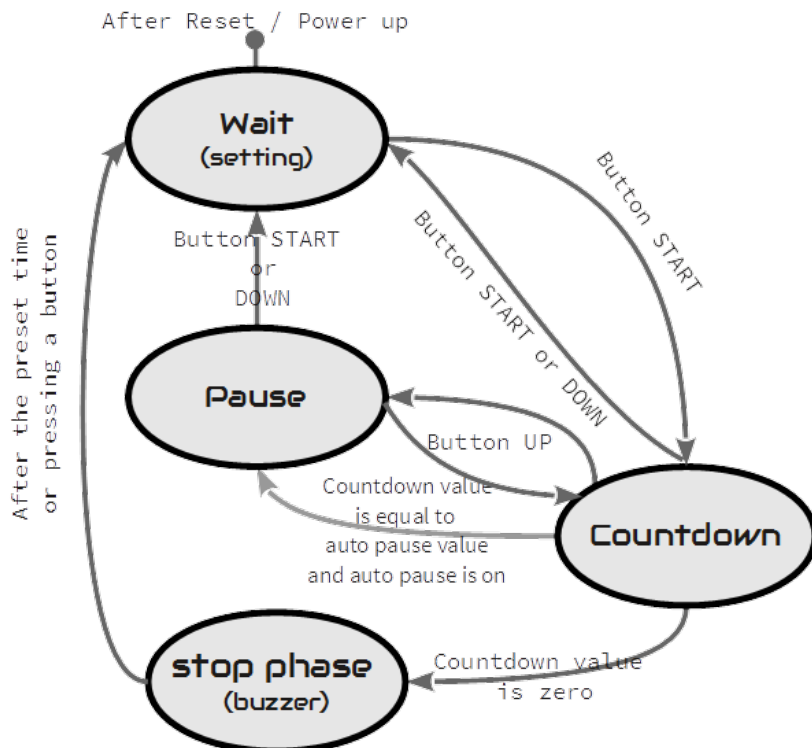

Abbildung 1: State diagram countdown mode

After reset / power up: Entry point after the reset and initialization.

Wait (setting): Setting the time is available, the time displayed on the screen is used as the next count down time. The Pin TiRe has a 0 (GND) at the output.

Countdown: In this operation, the time counted down in seconds and the decimal point (/SEGD) flashes every second. Pin the TiRe has a 1 at the output so VCC potential.

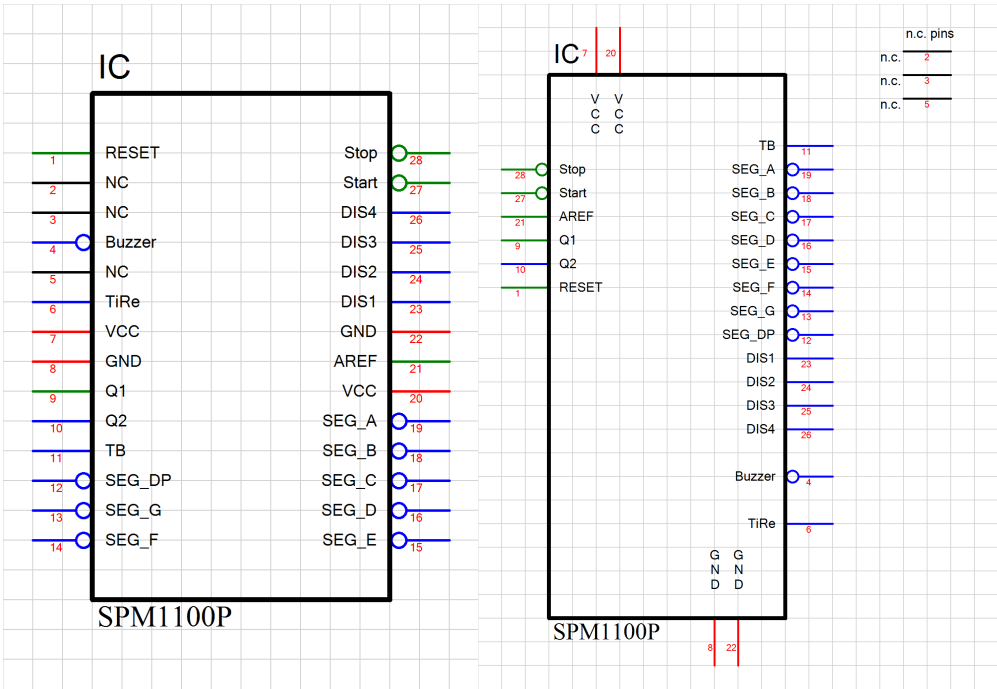

Pause: The countdown is interrupted and the whole display flashes. Pin TiRe has a 0 (GND) at the output.

Stop phase (buzzer): In this state, the TiRe pin is reset to 0 (GND) and the buzzer pin is up for 3 seconds (or set time) or upto pressing the button Start to 0 (GND).

Technical data

- Voltage (VCC): 2.7 V - 5 V
- Current: 20 mA (at 5 V)
- Power: approximately 100mW (at 5 volts)
- Number of Pins: 28
- Display Power: directly to the controller is the maximum LED current 40mA
- Clock frequency: 8MHz
- Other properties, refer to the datasheet for Atmel® ATmega8, ATmega88, ATmega168, ATmega168P, ATmega328P

Construction description

Pin assignment

Reset

Reset input to reset the microcontroller is normally not required. In case of higher EMC requirements a 100nF capacitor should be soldered to ground!

VCC

Operating voltage (2.7 V to 5 V)

AVCC

Analog operating voltage ($VCC \pm 0.3 V$), a coil should be connected with approximately 10μH between VCC and AVCC.

AREF

Internal analog reference voltage should be blocked with a 1 nF ceramic capacitor

GND

Ground

Q1, Q2

The connecting of the 8MHz quartz is shown in Figure 1

Figure 1: Connection of qaurtz

C1 and C2 are 27pF ceramic capacitors Q is an 8MHz

N.C.

Do not connect, connect to no other signal!

Start

This pin starts the countdown timer.

Stop

This pin stops the countdown timer.

TiRe

Output for the time relay, it has to reinforce to switch a relay with a transistor (for example BC547C).

Operating mode	State	Comment
"Setting Wait"	0 (GND)	
"Countdown"	1 (VCC)	
"Pause"	0 (GND)	
"Stop phase"	0 (GND)	

DIS1 to DIS6

The respective anode 7-segment display. DIS1 is the tens of minutes and DIS4 the ones digit of seconds. DIS6 simultaneously provides the mass for the button. Should be wired as in the wiring diagram of the basic circuit.

SEGA, SEGB, SEGC, SEGD, SEGE, SEGF, SEGG, SEGDP

Cathode terminals for LED segments of the 7-segment displays. Furthermore keys are connected to Seg A, Seg B, Seg C, Seg D .

Buzzer

On this connector a buzzer can be connected as an acoustic alarm optional. The plus pole must be connected to VCC pin of the buzzer, the minus pin must be connected with "Summer".

TB

Tap to verify the accuracy of the time base, max. 1.0001 kHz, the larger is the different from the 1 kHz the less accurate the IC. Production pin. You may adjust quartz capacitors.

Basic circuit

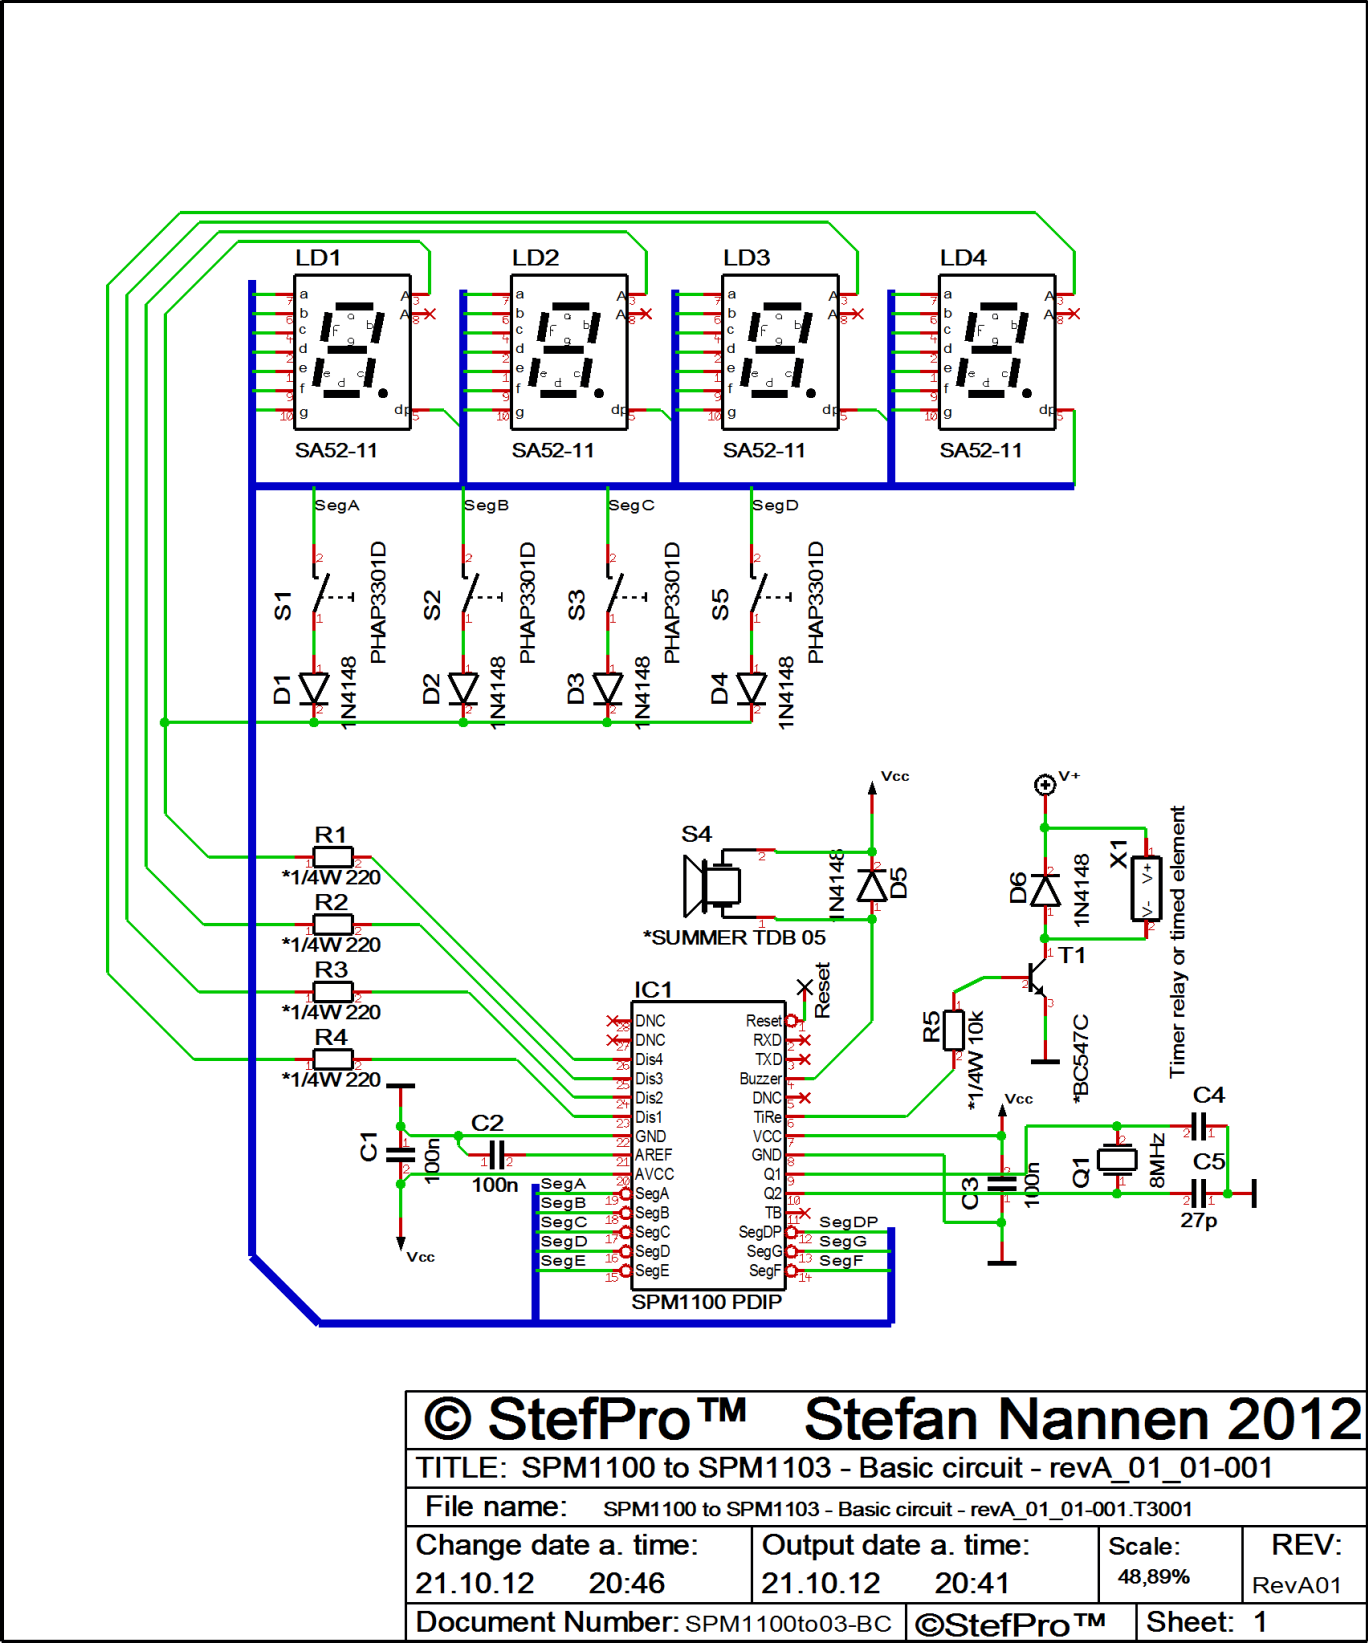

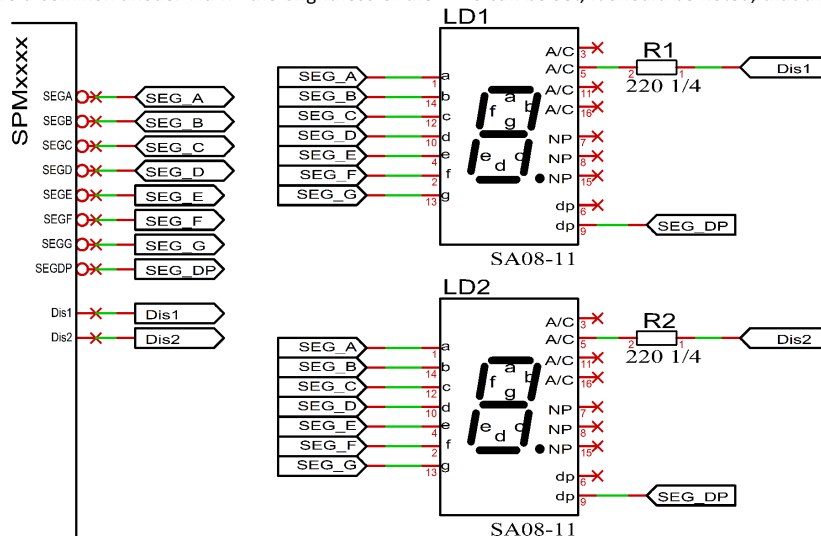

Figure 2: Basic circuit of SPM1100P

Properties of the components

7 segment displays

The seven-segment display LD1 must have a common anode. Via R1 the brightness of the LEDs can be set, it should be noted, that the maximum current with

direct control by the SPM1100P is 40 mA.

- ✓ Works fine - Funktioniert perfekt
- — Works but not fine - Funktioniert, aber nicht zu empfehlen
- X Doesn't work - Funktioniert nicht
- X Not tested, would not work directly - Nicht getestet, da nicht direkt möglich.

Figure 3: Differences of display readability brightness level 1

Figure 4: Differences of display readability brightness level 25

The displays in figure 3 and 4 are from left to right:

- SA52-11SRWA
- SA52-11EWA
- SA52-11YWA
- SA52-11GWA
- SA52-11QBWA-D

Figure 5: SA08-11SRWA left without and right with contrast pane with back light.

Figure 6: SA08-11SRWA left without and right with contrast pane without back light.

Below with and above without back light.

Because the displays are multiplexed (only one LED is lights at the same time for a maximum of 6 microseconds) to minimize component count and power consumption, not all 7-segment displays are usable.

Also note, that the displays which can work with 10 mA constant current, not implicitly work with 10 mA pulsed current. All displays have been limited with a 100 ohm resistor.

The brightness of the display is designed for the brightness conditions in a living room or laboratory. Since the circuit is optimized for minimum components and power consumption, the readability is limited with direct irradiation by spotlight or sunlight without a contrast panel very limited and with better.

It is recommended to place a contrast panel in front of the display, see figure 6 and 5.

Note: The menu is always displayed with 100% brightness.

Calculate the series resistor for one LED

- $U_{DS} \approx 0$
- $I_{LED} < 35 \text{ mA}$

Calculate the series resistor for two LED

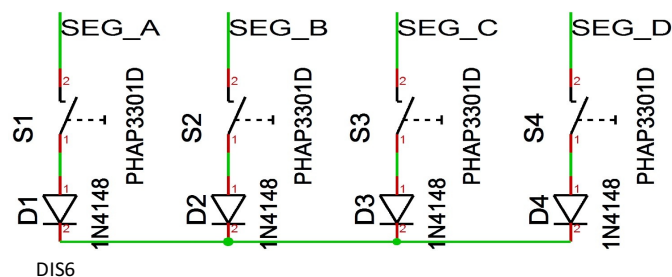

- $U_{DS} \approx 0$
- $I_{LED} < 35 \text{ mA}$

Keyboard

The keyboard consists of three to four buttons. It is expressly recommended to use digital compatible switches. The diodes D1 to D4 are for blocking display faults when pressing 2 and more keys.

The remote control of the controller is simply possible by parallel adding or replacing the button with NPN transistors.

Menu+ Menu- Plus Minus

Relais

In the basic circuit is shown how a relay or something like that can be connected. T1 used R5 as a series resistor, T1 is operated as an amplifier and also as an inverter. For T1 and R5, other components may be used. A direct connection of a coil or a load with more than 40 mA is not recommended direct with the SPM1100 - SPM1102. D6 is idle, the diode when operating with coils. If the controller frequently triggers a reset or has other mistakes, instead of a transistor a optocoupler should be used.

Buzzer properties

The buzzer B1 must be self-producing and have a minimum voltage of VCC. Does the buzzer have not VCC, a series resistor have to be installed. The buzzer may further maximum of 40mA directly from the IC SPM1100P. The plus pole of the buzzer have to be applied to VCC and the minus pin of the buzzer have to connected to the IC. D1 is the idle diode when operating with coils.

Button descriptions

The countdown timer is operated by 3 buttons.

Using the Countdown Timer - Outside of menu

- S1 is the start and stop button. If the countdown timer in the pause mode, the timer can be restart with this button.
 - S3 is the plus key, it increments the time. If the countdown timer is running, this button paused the countdown.
 - S4 is the minus key, it decrements the time. If the countdown timer is running, this button stops the countdown.
- These buttons are available only when the menu is not open, otherwise the keys are used by the menu.

Buzzer setting

With the button plus and minus the buzzer settings can be select. 0: No tone
1: 3 seconds after the counter ends
2: 9 seconds after the counter ends
3: infinitely until keystroke after the counter ends

Auto pause

With + you enter the sub-menu auto pause.

Auto pause

Enable auto pause

Enables the auto pause function.

Liability, warranty and copyright notice

Definitions

- "Programmed IC": IC which was developed by StefPro and can only used with a minimum basic circuit.
- "Manufacturer of the whole device": The manufacturer of the whole device, the natural or legal person is mounted a device which can be made to function without special knowledge. E.G. Simple connection to the network via a euro, safety plug or by connecting to a power supply.

Liability

- Although the information contained in this document has been checked very carefully for accuracy and completeness, for errors and omissions can not be held liable. StefPro reserves the right to any time change any portion of the described hardware and software features.
- StefPro delivers only the "programmed IC", a basic circuit and possibly an example circuit, but these are not tested for CE and EMC. The "Manufacturer of the whole device" requires the valid VDE, CE and EMC is comply with regulations.
- There is no liability for damages incurred directly by or in the application of the "programmed IC", as well as for damage caused by chemical or electrochemical effects of water or generally from abnormal environmental conditions.
- "Programmed IC's" by StefPro may not be used in critical equipment. At disregard exclusively the responsibility of "Manufacturer of the whole device."

These include:

- medical devices for implanting or life obtained.
- Critical equipment for space, aerospace and traffic.
- Other important life components or systems, where an error is fatal.
- All developed with a "programmed IC" by StefPro modules and devices must be the responsibility of the "Manufacturer of the whole device" sufficiently tested to detect any defects.

Warranty

- StefPro warranty only for the programmed IC and their firmware. The warranty is exclusively limited for the replacement of the IC within the warranty period for obvious defects in the hardware, and programming error.
- Warranty does not extend the warranty period or starts a new period again.
- Additional or deviating claims are excluded, especially claims for damages arising out of the product for damage. This will not affect claims based on inalienable rules under the product liability law.

Copyright notice

The circuit and the firmware on the programmed IC's by StefPro is Copyrighted. Unauthorized reproduction or distribution of programmed IC's with this program or any portion of it. This is pursued both criminal and civil law, and may result in severe penalties and compensation for damages.

Disposal information

Do not dispose devices in household garbage!

This modules or devices comply with the EU directive on electronic and electrical equipment (WEEE regulation) and therefore may not be disposed of with household waste. Dispose of the device over your local collection center for electronic equipment!
